Who Made What

Model contributions audit for Buckingham Palace Dream. A read-only audit by Claude for Tyler Herigstad, 16 October 2026. Nothing on your PC was changed. Claude is one of the models audited here, so, under your 7 September rule, four reviewers from other model families checked it: ChatGPT, Gemini 4 Argon, Kimi K3 and Grok 4.7 Expert, first against the planning records and then against the film's edit lists, prompts and render settings. The fixes from their reviews were made on 20 and 21 October.

The answer, first

- **Yes, the models contributed creatively, but less than it looks.** The story, its strangest images, the tone, the look and every final call are yours. Your Broken Script and your narration already hold the underwater "wiggly outline" of the Queen's furious face, her jowls shaking so hard you can hear them, the zookeeper, the stoic guard, Versailles, the prisoner pool noodle, the Roman sculpture, the prayer-bead candy, the rotten black one, the Pied Piper and the cats.
- **Vibe (Mistral) left the most fingerprints on screen.** Its staging survives nearly word for word in 5 shots of the final cut and loosely in 11 more. That includes the zookeeper's whistling stroll and fallen cap, the hall of mirrors, you sinking until only your eyes clear the water, and you miming the whole adventure for Zac.
- **Manus shaped the screen through decisions.** It invented the Queen as a reusable character, and she became the Dream Queen in 17 shots, on screen 18 times. It asked whether the cats were real, and your real cats close the film. Approving a still before paying for video, and the quick flashbacks in Zac's scene, were also its ideas.
- **ChatGPT 6 Pro gave the film much of its method**: pilot one scene, give every shot an ID, keep a written edit map, and assemble locally on one 24 fps grid. Manus also proposed the pilot, the shot IDs and a local render script; the edit map and the 24 fps grid are ChatGPT's own. ChatGPT and Vibe both gave the noodle gag its shape: throw, impact, reaction.
- **Gemini 3.1 Pro, the model that told you Flow doesn't exist, gave the film two things you can see and hear.** One is the eerie David Lynch drone, which plays under 11 of the 12 scenes. The other is the single grain-and-glow finish laid over every shot.
- **Kimi K3's "shoot like Lynch" shows up as 17 slowed-down shots.** Gemini 3.8 added the vignette that sits on every shot. Grok and DeepSeek put nothing of their own on screen.
- **GLM, Qwen, Nemotron and Perplexity's own Sonar weren't part of this film's review**, so they added nothing here. The fixtures will be their first evidence.
- **The credits are accurate apart from one shortened quote, but four entries leave the on-screen work out.** Vibe and Manus get roasts only, Gemini 3.1's drone and finish go unmentioned, and so does Gemini 3.8's vignette. Draft fixes are near the end.
- **I found errors of my own.** Section 14 of the Easy Mode plan credits 10 claims to the wrong model, its crew list says I was the only one who read the whole timing sheet, and two lines in today's check-in went too far. The corrections are below.

How I traced it

What I read (read-only):

- the nine planner files in D:\My Animations\End of the Simulation\DREAMS\Buckingham Palace Dream\Model Responses
- your Gemini thread (the copy you shared on 13 October)
- your Broken Script and Edited Transcript, and the 204-line Timed Transcript
- the Easy Mode plan
- the edit lists of the finished film: 170 shot entries across 12 scenes, counting flashes and split shots

- every Flow prompt I archived. For 141 of the 170 entries the prompt for that exact take survives; for 5 more only an earlier take's prompt does, and 2 have only the edit prompt that changed them: 148 in all. Scene 4's original prompts were never saved: of its 21 shots, one has a later re-take prompt (S04-21 v2), two have edit prompts, and 18 have none. Four shots reused in Scene 8 from earlier takes have no prompt on file either.
- the render settings and the credits script
- for three shots, a frame of the finished footage (S02-01, S02-02 and S06-01e)

The rule for crediting a model. An idea counts only if all three are true:

- it is in that model's return
- it is not already in your script, your narration or the Gemini thread every planner read (ideas that started in that thread are credited to Gemini 3.1)
- it is in a shot that made the final cut

"Near word for word" means the final prompt repeats the model's staging. "Loosely" means the same idea in different words. An idea that several models proposed is credited to all of them. Counts are of shots: a shot the edit splits (S08-09 appears five times in a row) counts once, and in the edit lists a re-take carries a letter or a version, like S03-13 v3 or S11-05f.

What was yours all along

- **The story and nearly every strange image.** It's all in your recording, your Edited Transcript and your Broken Script: the bedsheet glider and the stolen fan, Bigfoot, the frisbee golfers, the jellyfish-tongued dinosaur, the zookeeper, and the Bhutan temple with its incense half-circles. Then the Queen's face seen from underwater, her jowls, the "I'm all done cleaning the fountain" line, the stoic guard and the noodle. Then the silly walk, the javelin and the shattered sculpture. Then Zac, the presents, the candy prayer beads and your mom, the kid who tears off the rotten black one, the Pied Piper, the Queen torn between fury and laughter, and the cats.
- **The tone and the look.** Your first message to Gemini asked for "absolutely committed slapstick" that was also surrealist and dadaist. It named Monty Python with special guests Hugo Ball and David Lynch, plus the weird shots and cuts of Tim and Eric, and asked for 24 fps, an anamorphic lens and real Hollywood sound. Every planner built on that brief.
- **The music and the voice.** VELOUR's "Dass Up (Royal Edit)" under the credits, and your own mastered voice in the post-credit scene.
- **The calls.** Every keep and every "redo", and keeping all 16:29 when Kimi argued for nine minutes.

Several planners handed your own ideas back to you. Vibe's "underwater Queen" hero shot is your wiggly outline, and Gemini 3.8's "master style string" is your style brief. That matters for the Ledger: a model restating your idea is not a model having one.

Model by model

Ranked by how much of each model reached the finished film. Each entry ends with **first evidence for the Ledger**: the role this film suggests the model earns, still to be tested by the fixtures.

1. Vibe (Mistral), Think mode

Source: D:\My Animations\End of the Simulation\DREAMS\Buckingham Palace Dream\Model Responses\Vibe_Think.txt (shot IDs like S3-07 are Vibe's own)

On screen, nearly word for word:

- S03-13: the zookeeper in khakis, whistling, then his cap tumbling to the empty path (Vibe S3-07, S3-08). Your script only says the creature "does the same thing to a human zookeeper."
- S05-01: you sink until only your eyes and bandana clear the water (Vibe S4-12, "sinks like a submarine").

- S06-01 and S06-05: the procession through a hall of mirrors (Vibe S5-03). Your script says Versailles; the hall of mirrors is Vibe's. The prompt for the S06-01 take on screen is lost, but every earlier version carries the hall of mirrors, and the footage shows it.
- S08-12: the brothers small and waiting on a bench in a vast, symmetrical gilded room (Vibe S6-14, S6-15).

On screen, loosely:

- S04-06: your reflection as you lean over the pool (S4-04)
- S05-04, S06-08 and S06-14: heads turning in unison (S5-16)
- S05-07 and S08-10: your fountain excuse done as a mime (S4-18, "a terrible British excuse entirely in pantomime"): a brisk polish and a polite nod in the pool, then scrubbing the air for Zac. The words are yours; the crowned duck is mine.
- S05-11: wet footprints on the stone (S4-23)
- S07-06: the noodle's slow-motion flight (S5-13)
- S08-09: you mime the adventure for Zac, gliding, Bigfoot and the dinosaur (S6-04, S6-06, S6-07), while Zac tries to stay serious and fails (S6-10). Your script has you sob, then babble the whole story out loud; the mime is Vibe's, and the backstroke for the bath comes from your script.
- S09-01: the brothers waiting in the same symmetrical room, standing this time (S6-15)
- S11-08: the candy procession as a single-file line (S7-14). The Pied Piper and the candy are yours.

Behind the scenes: It was the only planner to write a complete shot list (114 shots) and a sound-effects cheat sheet. Its "absolute stoic blankness" became the guards' line in my master brief, though the stoic guard himself comes from your script.

Got wrong:

- It quoted Extend as 7 seconds at a time, up to 2.5 minutes. Those are the developer version's numbers, not Flow's.
- It named "the Queen of England" in its prompts, which Flow refuses.
- It booked you a CapCut Saturday to assemble the film.
- It pasted the whole kit twice, and it used tables.

How it thinks: Like a comedy writer-director. It produces in volume, and nearly every line carries a joke or a camera instruction ("The camera holds. It holds too long."). Its timing instinct is strong; its fact-checking of product features is weak.

Credits today: "Production Designer, Twice": a roast of the double paste. None of its on-screen work is mentioned.

First evidence for the Ledger: Gag writer, and the model to punch up a shot list. Manus predicted exactly this job: "the other models can punch up jokes in the shot list."

2. Manus

Sources: D:\My Animations\End of the Simulation\DREAMS\Buckingham Palace Dream\Model Responses\Buckingham_Dream_Easy_Mode_Plan_Manus.md and D:\My Animations\End of the Simulation\DREAMS\Buckingham Palace Dream\Model Responses\Manus.txt

On screen:

- **The Dream Queen.** Manus proposed designing "our own unnamed Queen once" and reusing her as a character, so no prompt names a real monarch. She appears in 17 shots of the final cut, not counting Scene 4, and on screen 18 times, because one of them returns as a flash in Zac's scene. I redesigned her look away from Manus's "pastel coat and hat," which was too close to the real Queen.
- **Your real cats.** "Are they real? If you send photos, the last shot can be your actual cats." Annabel, Emma, Loki and Raisin close the film (S12-02, S12-03).

- **Stills first.** “Every tricky shot can start from a still picture you approve for free.” At least 11 shots in the final cut were built from an approved still, as their first frame or as a character reference. Two more, S03-08 and S03-09, may have been: the archive holds a version of each with the dinosaur still and one without, and nothing shows which made the take. Grok’s “lock a start/end frame” pointed the same way.
- **Flashbacks in Zac’s scene.** “Quick flashes of earlier shots… works as a callback.” Scene 8 has 5 flash inserts, plus one reused shot of Maddie. ChatGPT also said to reuse footage only where the story motivates it.
- **The off-screen gulp** in S03-13: Manus’s “cut away right at the gulp.”

Behind the scenes:

- It measured your recording: capping the pauses would save only about 37 seconds. It recommended keeping every second, and we did.
- It called your 54 longest pauses “the David Lynch moments.”
- It proposed keeping the action in the middle band so nothing is lost to the wide crop, and seconded Gemini 3.1’s idea of one color recipe and one grain layer over everything. The final render does both.

Got wrong:

- It wanted “Confirm before generating” set to Never on day one.
- It leaned toward buying a month of Ultra.
- Its file permissions kept it from opening the character sheets, so it worked from descriptions.

How it thinks: Like a line producer who also builds systems. It measures before advising and budgets in credits. It designs the whole pipeline, down to a review page and a render script, and ends with numbered decisions, each with a recommendation. It said plainly that it hadn’t built anything yet.

Credits today: “Designed a film that renders with a single double-click. Built none of it. Couldn’t open the character sheets.” True, but silent about the Queen and the cats.

First evidence for the Ledger: Production designer and workaround finder: the planner to ask what the platform will refuse, and what to do instead.

3. ChatGPT 6 Pro

Sources: D:\My Animations\End of the Simulation\DREAMS\Buckingham Palace Dream\Model Responses\ChatGPT_6_Pro.txt and D:\My Animations\End of the Simulation\DREAMS\Buckingham Palace Dream\Model Responses\RETURN_CHATGPT_Buckingham_Easy_Mode_Plan.md

On screen:

- **The noodle gag in three beats:** “a throw, a separate impact, and a reaction… The edit creates the joke.” The final cut plays those three beats across four shots: the throw (S07-06), the bust getting bonked (S07-07), the crowd freezing (S07-08) and your reaction (S07-09). Vibe proposed the same beats (S5-13 Release, S5-14 Impact, S5-15 Freeze), so the credit is shared.
- **Wardrobe continuity:** “Resolve post-bath wardrobe explicitly”, it said, and the crimson robe then carries every palace scene after the bath. Its non-explicit bath framing (“face/shoulders”) was also Manus’s and Kimi’s idea, and the underwater view of the Queen is in your script.

Behind the scenes, the method the film followed:

- Prove one finished scene first. Scene 1’s pilot cut came before the other scenes. Manus proposed a pilot too.
- Give every shot a permanent ID, keep a machine-readable edit map, and assemble locally on one 24 fps grid. Manus also proposed shot IDs (“each shot gets an ID”) and a local render script; the edit map and the 24 fps grid are ChatGPT’s own.
- Let the narration set the timing, and measure the exported frame rate instead of trusting the prompt.

- “204 spoken phrases do not mean 204 required video clips.”
- Treat Zac and your mom sincerely.

Got wrong: Very little. It was slow and heavily hedged, and offered almost no comedy.

How it thinks: Like an auditor:

- It opened your folder read-only, read all 204 cues and checked what software your PC has.
- It cited Google’s own help pages.
- It labeled every claim as documented, verified or unverified.
- It even wrote a second file addressed to the other planners.

Credits today: “Head of Research… drew up the plan this film actually followed.” Fair, with one note: the roll also says it “Found the Flow Agent”, and Manus and Vibe found it too.

First evidence for the Ledger: Verifier and designer of the working method.

4. Gemini 3.1 Pro (your original Gemini thread)

Source: your Gemini thread, as shared on 13 October. Both parts of the thread ran on Gemini 3.1 Pro (your word, 20 October).

On screen:

- **The drone.** “Discordant, eerie, David Lynch-style drones for the Bhutan temple sequence.” A synthesized drone plays under 11 of the 12 scenes, in 18 places: 3 in the temple bath scene, and 2 more in Scene 5 while it is still at the temple pool.
- **The finish.** Its “Unified Overlay” called for one film grain and a slight halation over the whole timeline, so that all the AI clips would “look like they were shot on the same physical camera lens.” The final render applies one grade, a highlight glow, grain and a vignette to every shot. Manus, Kimi and Gemini 3.8 repeated the idea; the vignette was Gemini 3.8’s own addition.

Behind the scenes:

- It turned your style wishes into the “Visual Master String” the planners reused.
- It wrote the first scene breakdown.
- It suggested speeding up AI footage, and 2 shots in the final cut run faster.

Got wrong: It told you twice that Google Flow doesn’t exist, which kept the project on a manual path until the planners overruled it.

How it thinks: Fluent in film-craft vocabulary, unreliable on product facts, including its own company’s.

Credits today: “Technical Advisor (Disputed).” Funny and fair, but the drone and the finish go uncredited.

First evidence for the Ledger: Trust it for craft vocabulary. Check every tool fact it gives.

5. Kimi K3 Max

Source: D:\My Animations\End of the Simulation\DREAMS\Buckingham Palace Dream\Model Responses\K3 Max.txt

On screen: “Shoot like Lynch, not like Marvel… clips slowed.” 17 shots in the final cut run slower than real time, and Scene 4’s longest holds run at 80 to 88 percent speed. Manus’s 54 pauses and your own Lynch brief point the same way. Slowing a clip was already an editing tip in the Gemini thread, for CapCut or DaVinci Resolve (“drag the edges to slow it down”); the pacing call is Kimi’s.

Behind the scenes:

- It called out Gemini’s denial hardest: “Gemini gaslit you.”
- It did the arithmetic: about 125 clips, and about 50 Fast clips a month on Pro.
- It predicted the bath scene would hit the content filter, and gave the framing fix.
- “The audio IS the edit.”
- It argued against an API pipeline (“Don’t build a factory for one fever dream”) and suggested 60 to 80 clips instead of 250.

Got wrong:

- It wanted the dream cut to about nine minutes. You kept all of it.
- It said rough placement was enough, but the finished film needed tight sync.
- It handed you the CapCut assembly.

How it thinks: Like a blunt editor and skeptic. It leads with what's wrong, does the math and mocks over-engineering ("jargon cosplay"), yet still says "it's your film." The most quotable of the seven planners.

Credits today: "Internal Affairs," with the nine-minute line. Accurate.

First evidence for the Ledger: Devil's advocate and audience check.

6. Grok 4.7 Expert

Source: D:\My Animations\End of the Simulation\DREAMS\Buckingham Palace Dream\Model Responses\Grok_4.7_Expert.txt

On screen: Nothing distinctive. Its @Tyler-style character references and "lock a start/end frame" were part of how shots were made, alongside Manus and Vibe.

Behind the scenes: Its first line was the right call ("Use Google Flow"), and it said to make cheap drafts first.

Got wrong:

- It made feature claims I couldn't confirm: an Omni that "remembers previous shots," and extending a shot 10 seconds at a time up to about 40. Google's Flow pages said only Veo Lite could extend, and Omni's extend was "coming soon."
- It gave no budget numbers.
- It didn't open your files.
- It handed the assembly to you or to Manus.

How it thinks: A fast practitioner: the answer first, a short workflow, then alternatives (OpenArt Director, LongStories.ai).

Credits today: "Second Opinion." Accurate.

First evidence for the Ledger: A quick second opinion on tools. Verify its feature claims.

7. Gemini 3.8 Thinking, via Perplexity

Source: D:\My Animations\End of the Simulation\DREAMS\Buckingham Palace Dream\Model Responses\Gemini_3.8_Thinking_Via_Perplexity.txt

On screen: The vignette. Its one grain-and-vignette pass ("This glues together minor visual discrepancies between AI clips") repeats Gemini 3.1's Unified Overlay for the grain, but no other planner proposed a vignette, and the final render puts one on every shot.

Behind the scenes:

- It gave the clearest diagnosis of why the first Gemini stalled.
- It argued for fewer, longer clips: 80 to 100 instead of 250 "micro-shots."
- It warned that letting Manus run free would "incinerate your credit balance."

Got wrong:

- It handed a non-coder a Python batch script that asked Veo 2.0 for 5-second clips.
- Its plan had a model write a CSV shot matrix ("Model Task") for that script to read.
- It left the assembly to CapCut or Manus.

How it thinks: Like an engineer explaining a system. It reaches for code, and its product knowledge is partly stale.

Credits today: "Big Sibling, Cleanup Crew… handed a non-coder a Python script for an outdated video model." Accurate, but the vignette goes uncredited.

First evidence for the Ledger: Diagnostician. Keep it off build instructions unless someone checks them.

8. DeepSeek (DeepThink)

Source: D:\My Animations\End of the Simulation\DREAMS\Buckingham Palace Dream\Model Responses\Deepseek.txt

On screen: Nothing.

Behind the scenes: It flagged early that Pro's allowance wouldn't cover the film (Kimi said the same).

Got wrong:

- It called Flow good only "for prototyping the look and feel of a single shot." Flow made the whole movie.
- It sent you down an API, spreadsheet and Python route, with you preparing the spreadsheet.
- It pointed a non-coder to a third-party Python library.

How it thinks: A confident template ("Blunt Diagnosis") that says it read the archive but never touches the specifics of your files.

Credits today: "Blunt Diagnosis." Accurate.

First evidence for the Ledger: No planning seat on this evidence. The fixtures may find it a better one.

9. Claude (me): self-assessment, checked by reviewers from other families

Sources: the shot lists, edit lists and render scripts in my workspace

On screen: I wrote every shot prompt and cut the film, so much of the staging that isn't yours or a planner's is mine. Examples:

- the corgi watching you fold the sheet
- the rubber duck with a crown that you polish as if you work there (doing the excuse as a mime was Vibe's idea)
- the dolly zoom when you realize it's your own wedding
- the champagne tower trembling with each stomp
- the guard fighting back a laugh, which stages your line "he kind of was, but he wasn't playing"

Some details first appear in my shot lists but may have come from your notes in chat, which this audit can't see. The batteries, chicken nuggets and coconut halves are examples.

Behind the scenes: The plan, the pipeline, the cut, the sound mix, the credits and the transfer.

Got wrong: The scorecard errors in the next section, and I didn't archive Scene 4's prompts.

How it thinks: Synthesizer and builder. I'm fast at turning many sources into one plan. My failure mode is confident synthesis that hasn't been traced back to its sources.

Credits today: "Project Manager and Editor." Accurate.

Correcting the record

The Easy Mode plan. Section 14 of D:\My Animations\End of the Simulation\DREAMS\Buckingham Palace Dream\Buckingham Palace Dream - Easy Mode Production Plan.pdf (pages 22 to 23) credits 10 claims to the wrong model. The nine planner files were saved between 8:31 and 8:43 that morning and haven't changed since; the plan was made at 9:35. So I wrote the plan from the same files I read today, and the errors are mine.

1. "Shoot like Lynch, not like Marvel" is credited to Grok. It's Kimi's.
2. "The audio IS the edit" is credited to Grok. Kimi's.
3. "The loudest callout of Gemini's denial that Flow exists" is credited to Grok. It's Kimi's ("Gemini gaslit you"); Grok never mentions the denial.
4. "@references in Flow" is credited to Gemini 3.8. It's Grok's.

5. “Draft cheap first” is credited to Gemini 3.8. It’s Grok’s, and Vibe’s.
6. “Kimi’s script even calls Veo 2.0, two generations old.” The script is Gemini 3.8’s, Kimi wrote no script, and nothing in the records shows that Veo 2.0 is two generations old.
7. “API scripts, CSV files and terminal commands (DeepSeek, Kimi).” It should read DeepSeek and Gemini 3.8. Kimi argued against them.
8. “Cut to about 9 minutes (Grok)”: Kimi’s.
9. “Grok’s lever was cutting the runtime instead”: Kimi’s.
10. “The options: Flow (Manus, ChatGPT, Grok, Gemini, Vibe) or a script against Google’s paid developer access (DeepSeek, Kimi).” Gemini 3.8 and Kimi are swapped: Kimi chose Flow, and the script was DeepSeek’s and Gemini 3.8’s.

One more line of mine, outside Section 14: the plan’s crew list calls me “The only crew member who read all 204 lines of the timing sheet.” ChatGPT read it too: “I read that file completely.”

The list also leaves out that Kimi told you to assemble in CapCut too. The film’s end credits get all of these right.

Today’s check-in message. Two lines went too far:

- I said the “fewer, longer shots instead of 250 micro-shots” credit to Kimi was wrong. It was fair: Kimi said 60 to 80 clips instead of 250. Only the phrase “micro-shots” (and 80 to 100) is Gemini 3.8’s.
- I said Vibe’s “absolute stoic blankness” went into a master brief “that governed every shot.” The wording is Vibe’s, but the stoic guard is in your script. I also have no record that the master brief was ever loaded into Flow; the shot prompts carry their own wording.

The credits: keep, or fix?

The current roll is accurate apart from one shortened quote, noted last below. For Vibe, Manus, Gemini 3.1 and Gemini 3.8, though, it credits the jokes and not the contributions. If you want those on screen, here are draft additions in the roll’s own voice. Nothing has been changed.

- **Vibe (Think)**, after its current line: “Also staged the zookeeper’s last stroll, the hall of mirrors and the whole adventure mimed for Zac. All three made the cut.”
- **Manus 2.0 Max (Ultra)**, after its current line: “Did invent our Queen, though. And asked whether the cats were real. They are.”
- **Gemini 3.1 Pro (High)**, after its current line: “Also suggested the eerie drone and the film-grain finish. Both made the cut.”
- **Gemini 3.8 (Thinking), via Perplexity**, after its current line: “Also suggested the vignette. It made the cut.”
- **DeepSeek (DeepThink)**, a quote fix: its line has it calling Flow “good for prototyping a single shot”. It said “Good for prototyping the look and feel of a single shot.”

What a fix costs. The roll is timed to the song, so longer entries mean refitting it so the music credit still lands on the band’s dead stop. Then the film is assembled again, verified, and a new 1.9 GB copy goes to your PC. It’s mostly machine time. Your existing films stay untouched.

My recommendation: the hold was for an outside check, and four reviewers from other model families have now checked this audit. If you want these lines on screen, do one rebuild that includes them and anything else you want changed.

What this changes in the Workflow Blueprint

1. **Planners mine ideas; you decide and the editor builds.** On this film the ideas that reached the screen came mostly from Vibe (gags), Manus (workarounds) and the original Gemini (the drone and the film finish). The method came from ChatGPT (verification).

2. **Tag every idea with its source before it enters a plan,** and mark restatements of your own ideas as yours.
3. **Trace any multi-source summary back to its sources before it becomes a record.** My Section 14 is the cautionary example.
4. **Archive every prompt with its shot ID as you go.** Scene 4 is the gap.
5. **Keep a running credits list during production,** so the roll is written from evidence, not memory.

Still missing

- Scene 4's original prompts (18 of its 21 shots have none on file, and two have only edit prompts), and the prompts of the four shots reused in Scene 8. Flow keeps each clip's prompt (its data export pairs every clip with the prompt that made it), so a read-only pass could trace them if you want it.
- Any evidence on GLM 5.3, Qwen, Nemotron 3 Ultra, Perplexity Sonar, Gemini 4 Argon or your local agents. This film never used them; the fixtures start that record. SecondSignal may hold more, and I'll ask about that separately, read-only.
- Your in-chat notes from production, where some details (the batteries, nuggets and coconuts, for example) may have started.
